

Chapter 1

Introduction to libSRTP

This document describes libSRTP, the Open Source Secure RTP library from Cisco Systems, Inc. RTP is the Real-time Transport Protocol, an IETF standard for the transport of real-time data such as telephony, audio, and video, defined by RFC1889. Secure RTP (SRTP) is an RTP profile for providing confidentiality to RTP data and authentication to the RTP header and payload. SRTP is an IETF Proposed Standard, and is defined in RFC 3711, and was developed in the IETF Audio/Video Transport (AVT) Working Group. This library supports all of the mandatory features of SRTP, but not all of the optional features. See the [Supported Features](#) section for more detailed information.

This document is organized as follows. The first chapter provides background material on SRTP and overview of libSRTP. The following chapters provide a detailed reference to the libSRTP API and related functions. The reference material is created automatically (using the doxygen utdutt21l embedd98(cre8ped)-re8psom tll C

Considerations section of the Internet Draft. In addition, it is important that you read and understand the terms outlined in the [License and Disclaimer](#) section.

be distinct. This requirement can be enforced by using the convention that each SRTP and SRTCP key is used for encryption by only a single sender. In other words, the key is shared only across streams that originate from a particular device (of course, other SRTP participants will need to use the key for decryption). libSRTP supports this enforcement by detecting the case in which a key is used for both inbound and outbound data.

1.6 libSRTP Overview

1.7 Example Code

This section provides a simple example of how to use libSRTP. The example code lacks error checking, but is func-

Functions

- `err_status_t srtp_init (void)`
srtp_init() initializes the srtp library.
- `err_status_t srtp_shutdown (void)`
srtp_shutdown() de-initializes the srtp library.
- `err_status_t srtp_protect (srtp_t ctx, void rtp_hdr, int len_ptr)`
srtp_protect() is the Secure RTP sender-side packet processing function.
- `err_status_t srtp_unprotect (srtp_t ctx, void srtp_hdr, int len_ptr)`
srtp_unprotect() is the Secure RTP receiver-side packet processing function.
- `err_status_t srtp_create (srtp_t session, const srtp_policy_t policy)`
srtp_create() allocates and initializes an SRTP session.
- `err_status_t srtp_add_stream (srtp_t session, const srtp_policy_t policy)`
srtp_add_stream() allocates and initializes an SRTP stream within a given SRTP session.
- `err_status_t srtp_remove_stream (srtp_t session, unsigned int ssrc)`
srtp_remove_stream() deallocates an SRTP stream.
- `void crypto_policy_set_rtp_default (crypto_policy_t p)`
crypto_policy_set_rtp_default() sets a crypto policy structure to the SRTP default policy for RTP protection.
- `void crypto_policy_set_rtcp_default (crypto_policy_t p)`
crypto_policy_set_rtcp_default() sets a crypto policy structure to the SRTP default policy for RTCP protection.
- `void crypto_policy_set_aes_cm_128_hmac_sha1_32 (crypto_policy_t p)`
crypto_policy_set_aes_cm_128_hmac_sha1_32() sets a crypto policy structure to a short-authentication tag policy
- `void crypto_policy_set_aes_cm_128_null_auth (crypto_policy_t p)`
crypto_policy_set_aes_cm_128_null_auth() sets a crypto policy structure to an encryption-only policy
- `void crypto_policy_set_null_cipher_hmac_sha1_80 (crypto_policy_t p)`
crypto_policy_set_null_cipher_hmac_sha1_80() sets a crypto policy structure to a null cipher policy

4.1.1.2 `#define SRTP_MAX_TRAILER_LEN SRTP_MAX_TAG_LEN`

adequate only for protecting audio and video media that use a stateless playback function. See Section 7.5 of RFC 3711 (<http://www.ietf.org/rfc/rfc3711.txt>).

This function is a convenience that helps to avoid dealing directly with the policy data structure. You are encouraged

4.1.4.4 void crypto_policy_set_aes_cm_256_hmac_sha1_32 (crypto_policy_t *p*)

Parameters:

p is a pointer to the policy structure to be set

The function call `crypto_policy_set_aes_cm_256_hmac_sha1_32(&p)` sets the

Returns:

void.

4.1.4.6 `err_status_t crypto_policy_set_from_profile_for_rtcp (crypto_policy_t policy, srtp_profile_t profile)`

Parameters:

p

4.1.4.10 void crypto_policy_set_rtp_default (crypto_policy_t *p*)**Parameters:***p*

policy is the [srtp_policy_t](#)

packet and

Returns:

- `err_status_ok` if the stream deallocation succeeded.
- [other] otherwise.

4.1.4.17 `err_status_t srtp_shutdown (void)`**Warning:**

No srtp functions may be called after calling this function.

4.1.4.18 `err_status_t srtp_unprotect (srtp_t ctx, void srtp_hdr, int len_ptr)`

4.4 Cryptographic Algorithms

Modules

- [Cipher Types](#)

4.5.1 Detailed Description

A `cipher_type_id_t` is an identifier for a `cipher_type`; only values given by the defines above (or those present in the file [crypto_types.h](#)) should be used.

libSRTP

4.5 Cipher Types

4.6 Authentication Function Types

Each authentication function type is identified by an unsigned integer. The authentication function types available in this edition of libSRTP are given by the defines below.

Defines

- #define `NULL_AUTH` 0
The null authentication function performs no authentication.
- #define `UST_TMMHv2` 1
UST with TMMH Version 2.
- #define `UST_AES_128_XMAC` 2
(UST) AES-128 XORMAC
- #define `HMAC_SHA1` 3
HMAC-SHA1.
- #define `STRONGHOLD_AUTH` HMAC_SHA1
Strongest available authentication function.

Typedefs

- typedef uint32_t `auth_type_id_t`
An `auth_type_id_t` is an identifier for a particular authentication function.

4.6.1 Detailed Description

An ide6 T036_id_tan identTd 02erAn authentTd 0ion f36_-250;0(f[-2only0(f36_-278(alued_t)Td (are)-250(gi)25(Td by0(f36_0(by)-Tc

4.6.2 Define Documentation

4.6.2.1 #define HMAC_SHA1 3

4.8 Cryptographic Kernel

Modules

- [Ciphers](#)

A generic cipher type enables cipher agility, that is, the ability to write code that runs with multiple cipher types. Ciphers

4.9.1.2 `err_status_t` `cipher_encrypt` (`cipher_t` *cipher*, `void`

Chapter 5

Data Structure Documentation

5.2 debug_module_t Struct Reference

The documentation for this struct was generated from the following file:

- err.h

5.3 srtp_event_data_t Struct Reference

[srtp_event_data_t](#) is the structure passed as a callback to the event handler function

Data Fields

- [srtp_t](#) session
- [srtp_stream_t](#) stream
- [srtp_event_t](#) event

5.3.1 Detailed Description

The struct [srtp_event_data_t](#) holds the data passed to the event handler function.

5.3.2 Field Documentation

5.3.2.1 srtp_event_t srtp_event_data_t::event

An enum indicating the type of event.

5.3.2.2 srtp_t srtp_event_data_t::session

5.3.2.n0 0 1 rg 0 0 3l15(ent)-2505(tyo60 GEnnd50(of)-250(e)25(v)15(ent.))TJ/F32 9.9626 62 Tf 72 692. 0 t)-25 0 1 [(5.3.2.2)-1000
